

Delete Rear Wiper Blade Assembly

Tuesday, August 11, 2026 1:29 PM

I used the FSM to get the back hatch trim removed. You also need to remove the metal nut retainer, nut, wiper itself, and grommet from the outside before trying to remove the whole motor assembly. The FSM states that you have to pretty much remove everything (back window, all access panels, etc) to get the rear wiper motor assembly removed. That sounded like too much of a PIA. The wiper motor assembly is pretty small and I wanted to see if I could remove it without all that.

I took the main, larger access panel loose and let it hang by the cabling. Looking up in the cavity, You can see the rear wiper motor assembly. There are 3 bolts total holding it onto the hatch metal frame: 2 can be seen from this view (I've already removed the closest one that doesn't have a bolt in there and the other one hasn't been removed yet):

The other one can be seen from the other side:

Yep, you guessed it. The first 2 are easy to remove and that last one with the cable in the way is the worst...

All 3 are 10mm. I used a longer extension ratchetting wrench to get the first one, then you can get the second one through an access hole with an impact. Seen here:

Finally, with that 3rd one I went in through this access hole from the pic below with an extension and swivel end for a 10mm from my impact:

Then I took my other hand and guided it to the bolt, while moving the harness out of the way, and slowly let the impact do it's work. It came out surprisingly well.

Now, the final step is removing some additional tape that was holding the motor assembly to that cross harness. I just got some sharp cutters in there and slowly snipped away at the tape - being careful NOT to cut the harness itself:

Now you can guide it out the right of the back window motor assembly. It's a tight fit but it works! Here's the pic for proof:

Now, I wanted to snake my rear camera wiring from inside the cab to the back hatch cavity (for now). I haven't finished this yet because I want to draw up a combo grommet / rear camera mount to use in the hole the hatch wiper came out of.

Here is some in process of me snaking the wiring. This is the best path I could find and easiest to get. I had to poke through the grommet that came into the cab and route this through some other unused holes. I'll make more grommets for these holes that I created but just showing the path for now.

I'm following the main wire harness after this point:

Here's another shot picking up where that last one left off. Following the harness and then coming through that main grommet into the hatch. I just left it inside the hatch for now:

Oh, and I also popped off the rear wiper retainer thingy that is in the back hatch since I won't need that anymore. Yes, I'll need to find a way to fill this spot but thinking of a cool design I can print and pop in it's place.

You have to start pulling it out, then get a flat head and push from top-down on that back recessed clip. Then it'll come right out.

Here is the rough, final result. Now time for the fun, design stuff!
